

Bayesian Statistical Methods and Data Analysis, HS2026

Instructor: Patrick Meyers

Teaching Assistants: Uddipta Bhardwaj, Giada Badaracco

Course times, location: Wednesdays 9:45 - 12:30 in HCI H 8.1

Registration/deregistration deadline: Will be posted to moodle.

Evaluation: Graded semester performance, based on a **written project** and associated presentation.

Links: [moodle](#), [github](#), [jupyterlab](#)

Resources: All required resources will be posted to moodle or github. A list of recommended textbooks, python tutorials, etc. can be found [here](#).

Topics covered: A list of topics, and associated exercises can be found [here](#).

Project guidelines: A more detailed project assignment, with suggestions and resources will be posted to the moodle.

- Groups of up to 4 people can work together on a single topic. The topic and groups will be chosen by Week 4. A 0.5-1 page proposal will be submitted by the end of Week 5.
- Presentations will be scheduled for the last 2-3 weeks of the course. Everyone in a group gets the same grade on the presentation.
- Each student will write their own report.
- Analysis for the projects can be done together, reports written separately.
- The whole group should put together a brief (~1-2 paragraph) contribution statement that gets attached to each individual's report.

Use of AI and LLMs: The main goal of this course is for you to learn the fundamentals of Bayesian statistics, how to apply them, and how to build a python toolbox. For this reason, we ask that, in class, you refrain from using or asking LLMs to answer questions, solve problems or write code.
